

LogicMonitor

Hosted Monitoring of Network • Servers • Applications • Storage • Cloud 

LogicMonitor gives you performance graphs, alerts, and reporting out of the box - no configuration or monitoring expertise required.

LogicMonitor takes the complexity out of monitoring. And puts the business value in.

It's no secret that effective monitoring is one of the biggest things an enterprise can do to increase uptime and end-user satisfaction.

It's also no secret that most monitoring systems are a nightmare to install, configure and maintain. Which explains why so many enterprises never get past a very basic level of monitoring, which, with today's complex IT infrastructure, is simply not sufficient.

To achieve maximum business continuity, where employees don't call wondering why they can't access their email, and where your website doesn't suddenly take forever to load causing visitors to leave, costing you in revenue/reputation, you need automation. That's what LogicMonitor delivers.

From pre-configured templates that allow you start monitoring new devices in seconds, to its ActiveDiscovery™ engine that detects any changes to your environment and automatically updates monitoring, to its maintenance-free hosted architecture, LogicMonitor dramatically reduces the complexity and time required to achieve - and maintain - effective monitoring.

Instead of requiring large upfront capital investment and months of costly staff time to setup, you can now have enterprise-class data center monitoring within just 30 minutes. At an SMB price.

Key Features

- ➔ View your physical, virtual, and cloud infrastructure from one portal
- ➔ 24x7 email / SMS paging
- ➔ Historical trending up to 1 year
- ➔ Pre-configured templates allow you add monitoring to new devices in seconds
- ➔ ActiveDiscovery™ engine detects any changes to your environment and automatically updates monitoring
- ➔ Accessible from any browser
- ➔ Deploys in minutes
- ➔ No setup fees or upfront costs

Key Benefits

Know exactly what's going on within your infrastructure so you can proactively resolve issues before they impact your business.

Receive alerts that don't just tell you something's wrong, but actually give you suggestions on how to resolve the issue.

Simplify troubleshooting. No matter where you are, open a browser and get a complete picture of all your systems from a single pane, and quickly pinpoint the cause of performance issues.

Spin up 100 new virtual machines, or add a new volume, or database instance and have peace of mind knowing they will all be monitored instantly, without you doing a thing.

Pull up long-term trending graphs that clearly illustrate when you'll need to expand, and when to stick with what you have.

Eliminate having to purchase, manage, and learn another monitoring product each time you add a new vendor's equipment to your infrastructure.

Scale quickly without having to hire another system administrator.

Never buy another monitoring server, or perform another backup, or pay for another software upgrade.

Simplify your life with LogicMonitor. ●●●

"For each year we've used LogicMonitor, we've been able to defer the cost of a full-time SysAdmin hire, estimated at \$120,000 a year."

How LogicMonitor Works

Even though LogicMonitor is a hosted service, you do not need to allow LogicMonitor servers any access through your firewalls. A small collector running inside your enterprise's firewall collects and sends data via encrypted SSL to LogicMonitor servers running in our secured data centers. Performance graphs are viewable from your portal, which you access from any browser. Our servers will alert you to issues via email, SMS, or phone call.

Features that are good for IT, and good for business.

Flexible Alerting: Ensure the right people get the right alert at the right time. Route alerts by host name, group, service, or even time of day. Alert via email, SMS, or phone call (via text-to-speech). Escalate through groups of contacts. Acknowledge, escalate or respond to alerts from your phone.

Dashboards: Easily create and share custom views that show what matters to you.

Interactive Graphs: Zoom in, zoom out, remove or add lines to get exactly the view you are looking for. Faster troubleshooting, quicker problem resolution.

Reports: Automatically generate periodic reports for alerts, performance metrics, SLA statistics.

Top 10 Overview Graphs: At-a-glance views of multiple objects so you can easily see which volume, interface or Virtual IP needs attention.

Custom graphs: Need to see the storage usage of all business units in your enterprise, across multiple data centers? Custom graphs will let you plot that (or anything else) quickly and easily.

Role Based Access: Control which users can see which dashboards, graphs, and reports.

Ease of Configuration: No need to know what to monitor, or spend hours configuring. Simply enter a host name and LogicMonitor will automatically discover everything about the device, and start monitoring, graphing, and alerting.

Cloud Ready: Automatically detects when new machine instances are launched or destroyed, and adds/removes them from monitoring automatically.

Reduce Costs, Risk: SaaS delivery means zero capital investment: no in-house servers, hardware, or maintenance. No upfront software costs or long term contracts.

Free Support: Phone, email, chat support from team of data center monitoring experts included at no charge.
